Amirhossein Arzani. (Northern Arizona University) Obtaining high-fidelity blood flow data is a challenging task. High-resolution patient-specific computational fluid dynamics (CFD) simulations are sensitive to uncertainty in boundary conditions and model parameters. On the other hand, imaging

methods such as time resolved phase contrast magnetic resonance imaging (a.k.a 4D-Flow MRI) suffer from low spatio-temporal resolution and acquisition noise.

Molecular dynamics (MD) is a computer simulation method for analyzing the physical movements of atoms and molecules. The atoms and molecules are allowed to interact for a fixed period of time, giving a view of the dynamic "evolution" of the system. In the most common version, the trajectories of atoms and molecules are determined by numerically solving Newton's equations of motion for a system ...
