Software design pattern on Wikipedia; Collection of implementation examples; Factory. One of the most commonly used design patterns is the factory pattern. In this pattern, a class simply creates the object you want to use. Consider the following example of the factory pattern:

[Design Patterns - PHP: The Right Way](#)

1. Copying all (including private) properties manually (you could also use get_object_vars(), but this is shorter): <?php \$clone = new BugDetails (); foreach (\$this as \$key => \$val) { \$clone-> \$key = \$val; }> 2. Serialize an object Bug, manipulate the resulting string so that it has BugDetails inside and unserialize it.

[PHP: Objects - Manual](#)

[PHP in action](#) gives readers a clear concept of objects in PHP, like private and protected methods and variable, the limitation of constants in PHP, different interfaces in PHP5 versus Java. This book is suitable for students who have the basic understanding of PHP or other programming language, if you are going to build up a web application, this is the book for you !

[PHP in action: objects, design, agility by Dagfinn ...](#)

[Objects, Design, Agility](#) | the subtitle sums the book up quite well; [PHP In Action](#) is all about object oriented programming in PHP. I owe its authors a lot for having introduced me to the wonderful world of OOP. [PHP In Action](#) starts off with an introduction to classes, objects and inheritance. For the beginner programmer this is vital reading but if you can already tell an interface from an abstract class, you might as well skip ahead to part two.

When the user fills out the form above and clicks the submit button, the form data is sent for processing to a PHP file named "welcome.php". The form data is sent with the HTTP POST method. To display the submitted data you could simply echo all the variables. The "welcome.php" looks like this:

[PHP Form Handling - W3Schools](#)

PHP is designed to interact with HTML and PHP scripts can be included in an HTML page without a problem. In an HTML page, PHP code is enclosed within special PHP tags. When a visitor opens the page, the server processes the PHP code and then sends the output (not the PHP code itself) to the visitor's browser.

[PHP in Action - NIWA](#)

Object/action interface, also abbreviated as OAI, is an extension to the graphical user interface, especially related to direct manipulation user interface and it can help to create better human-computer interfaces and increase the usability of a product. There are basically two similar models regarding OAI. This model focuses on the priority of the object over the actions (i.e. it emphasizes the object being selected first, and then any action performed on it. OAI adheres to this model.

[Object/action interface - Wikipedia](#)

The name=;postname; is the one that is accessible by using the \$_POST PHP array. Similarly, other form fields can be accessed, including select dropdown by using the name of each field in PHP script. AS you submit the form, following PHP script with \$_POST is used to get the entered values:
